Short details about my Research Experience:

PhD work [5 yrs]: Both experimental and theoretical works were performed. Experimental part includes:

- (i) High energy characterisation of the Compton suppressed Clover detector,
- (ii) In-beam gamma-ray spectroscopic studies of high spin states of ^{35}Cl in mass 40 region, and
- (iii) X- and gamma- ray spectroscopic studies of fission fragments of ^{252}Cf spontaneous fission source in mass ^{132}Sn region.

The theoretical study supplemented the experimental findings using the microscopic Shell model and the phenomenological Particle Rotor model. Apart from my PhD thesis work, I have participated in various collaborative projects of our nuclear physics group and have actively participated in more than dozen experiments.

1st PDF at TRIUMF & Simon Fraser University (Vancouver, Canada) [2 yrs]: I proposed and performed an experiment at TRIUMF with ^{11}Be radioactive beam for the characterisation of TIGRESS detectors up to 8 MeV. I have participated in almost a dozen experiments on Nuclear Structure and Nuclear Astrophysics at TRIUMF using TIGRESS, 8pi, TUDA and other detector systems.

2nd PDF at Saha Institute of Nuclear Physics [1y 8m]: I have independently developed a formalism for modeling of various composite detectors including clover, cluster and spectrometer for INTEGRAL satellite. At present, I have **seven single author publications** and one joint paper with my PhD student on this work and I have given an invited talk in International Symposium on Nuclear Physics at BARC, Mumbai in Dec 2013. **Based on the work published in seven single author papers, I am preparing for the D.Sc thesis to be submitted to University of Calcutta.**

3rd PDF at INFN LNS (Catania, Italy) [5 m]: I have participated in an experiment for studying the $^{19}\text{F}(\alpha, p)^{22}\text{Ne}$ reaction via the Trojan Horse Method applied to the $^{19}\text{F}({}^6\text{Li}, p){}^{22}\text{Ne}$ three-body reaction.

Research from 2013 onwards (as Faculty)

I am performing research on mathematical modeling and experimental studies of the response of composite germanium detectors. Motivated by the various shapes and configurations of detectors used in modern gamma arrays, we use probabilistic formalism to model the operation of a composite detector comprising of elements arranged in series and parallel combination of detectors. Considering up to four detector hit events, expressions for the performance parameters like the addback factor and the peak-to-total ratio have been obtained. The general trend of predicted values of the addback factor, the peak-to-total ratio and the fold distribution match with the available experimental data for other composite detectors. Our novel phenomenological approach could provide a guidance in designing new detectors for gamma-ray spectroscopy.

Together with my four PhD registered scholars [Pintu Bhattacharya, Pankaj Sarkar, Anneswa Chakraborty, Ankhi Samui], we have attended several national and international conferences where we presented oral and poster presentations. I have also given few invited talks. Recently, Pintu and Pankaj have submitted their thesis.

Our group has published 9 refereed int. journal papers and 5 refereed conference papers with doi/isbn.
